                                                                                                                                                                                                                                                                                                                                                  NOTE: This is a 'working draft' sequence. It currently consists of 9 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence.
                                                                                                                                                                                                                                                                                                          as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    unordered pieces.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   뮍
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel G-protein-coupled receptor up-regulated Cin prostate cancer, termed PHOR-1. The encoding cDNA is contained in CD plasmid designated ph0197811 deposited with ATCC as Accession No.PTA-312. PHOR-1 polypepides and polymucleotides are useful for diagnosing the CC presence of cancer, especially prostate, kidney, uterine, cervical, ct. of the CC protein or mRNA expression in test and normal tissue samples. CC Pharmaceutical compositions comprising PHOR-1 is useful for treating CC cancer. PHOR-1 proteins are useful for identifying ligands and other agents and collular constituents that binds to PHOR-1 gene product and CC imaging methodologies and for the treatment of prostate cancer. Cell inse expressing PHOR-1 are useful for identifying protein-protein CC interactions mediated by PHOR-1. The present sequence represents the homologue of olfactory receptor-1).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                              organisms such as humans or other mammals (e.g. mice, sheep and dogs). The methods of the invention are useful for diagnosing and treating prostate cancer in mammals. The prostate cancer as well as for useful for diagnosing or treating prostate cancer, as well as for identifying modulators of prostate cancer or agents that inhibit prostate cancer. The nucleic acid sequences are particularly useful in gene therapy, as a vaccine or in antisense applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detecting a prostate cancer-associated transcript in a cell in patient, useful for diagnosing prostate cancer (PC) or screenimedulators of PC, by determining if prostate cancer-associated are expressed in a prostate tissue
                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              are differentially expressed in prostate tumour tissue or in prostate cancer and are derived from the tissues of various
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          prostate cancer-associated polynucleotides (designated PC genes) that selectively hybridise to a sequence that is at least 80% identical to them. The prostate cancer-associated polynucleotide sequences

The GCRP polypeptides, polynuclectides, antibodies, antagonists ar agonists may be administered to human patients for the diagnosis, treatment and prevention of nervous system disorders (e.g. epileps stroke, neoplasms, Alzheimer's disease), autoimmune or inflammatory disorders, complications of cancer, hemadialysis and extracorporeal circulation, and cell proliferative disorders. The also used to treat or prevent disorders associated with decreased increased expression or activity of GCRP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence encodes human G-protein coupled receptor protein (GCRP) The GCRP polypeptides, polynucleotides, antibodies, antagonists and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               polynucleotides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer especially prostate cancer. Compositions comprising the polynucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for detecting cancer. The oligonucleotide is useful for notice that of the present sequence is a prostate specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   29-AUG-2000;

New human G-protein coupled receptor X, GPCRX, polypeptide useful in treatment or prevention of GPCRX associated disorders e.g. cardiomyopathy or atherosclerosis, and to screen for antagonists and agonists useful therapeutically

Claim 1; Page 55; 157pp; English

The invention relates to nucleic acid sequences (ABA81529-ABA81522) that CC encode G-coupled protein-receptor related polypeptides
CC (ABB44523-ABB44543). The isolated polypeptide having a sequence differing
CC by no more than 15 % of amino acid residues from one of 22 amino acid
CC sequences (or mature forms of the sequences) fully defined in the
CC sequences (or mature forms of the sequences) fully defined in the
CC entiated in and corresponding to human G-protein coupled receptor x
CC (GPCRX) polypeptides. The polypeptides have potential cardiant,
CC entiated rissclerotic, anabolic, cytostatic and antiviral activity. The
CC polypeptides can be administered therapeutically, especially using gene
CC therapy and expressing the encoding DNA in vivo, to treat or prevent
CC GPCRX-associated disorders, especially in humans. For example, they can
be used to treat/prevent cardiomyopathy, atherosclerosis, disorders
CC related to signal processing and metabolic pathway modulation (e.g.
CC obesity, amorexia), diabetes, osteoporosis, Crohm's disease, multiple
CC sclerosis, asthma, cancers, neurodegenerative disorders (e.g. Alzheimer's
CC disease, parkingon's disorder, Huntington's disease, multiple colleges, parkingon's disorders, developmental diseases, neurological disorders,
CC haematopoietic disorders, developmental diseases, neurological disorders,
CC mamunodeficiency virus (HTV)-1 or HTV-2). They can be used diagnostically
CC with altered levels of the polypeptide expression levels relative to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                control samples. They are useful to identify agents binding polypeptide (e.g. cellular receptors or downstream effectors) and/or agents modulating cellular polypeptide expression or activity, useful as antagonists and agonists in disease treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                            13-MAR-2001; 2001WO-US07771.

The OR's specifically recognise molecules, odourants, that elicit specific olfactory sensation. The human olfactory receptors and polynucleotides encoding them are useful for screening a library of chemical compounds for compounds that are involved in olfactory sensation. Modulators of their activity are useful for pharmacological and genetic modulation of olfactory signalling pathways. Therefore, they can be used in the food, pharmaceutical and cosmetic industries to customise odours and

(II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), antibodies to (II), fusion proteins comprising (II), and isolated I cells prepared using (I) or (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used in vaccines. The antibodies or (I) can be used for monitoring the progression of cancer in a patient. (I) and (II) can also be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AAH93137 to AAH9394 and AAM01115 to AAM01318 represent polynucleotide and amino acid sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Xu J, Di.

GPCR is also referred as seven transmembrane receptor. G protein-coupled receptor protein is useful for treating neurological disorder, particularly schizophrenia. GPCR protein is also useful for identifying compounds useful for treating other schizophrenia. These compounds are also useful for treating other neurological and psychiatric diseases, e.g. depression, anxiety, bipolar disease, affective disorders, attention deficit hyperactivity disorder/attention deficit disorder, epilepsy, neuritis, neurasthenia, neuropathy, neurosis, Alzheimer's disease, Parkinson's disease, migraine and senile dementia. The invention also provides genetic screening procedures that entail analysing a person's genome with respect to GPCR. The vectors are useful for the recombinant production of the GPCR's. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is an olfactory receptor which is encoded by one of a number of novel polymucleotides. The polymucleotides can be used in screening for olfactory agonists and antagonists. The methods allow for the determination of primary scents and the identification of the odour receptors used to detect these primary scents. The methods also enable determination of secondary scents and the identification of combinations of odour receptors that are involved in detecting such secondary scents. This enables the construction of a scent representation (also called a scent fingerprint or scent profile), which may be used to re-create and edit scents. Libraries of olfactory receptors are useful for determining the interaction pattern of a composition with the receptors, and can be used determining differences in the olfactory

The receptor proteins and encoded genes are useful for studying in vivo signal transduction mechanism and identifying targets for drug development e.g. based on olfactory and gustatory receptors in form of agonists and antagonists by screening intrinsic and extrinsic ligands as bitter taste inhibitors, taste enhancers and fragrance improvers.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp. wipo.int/pub/published_pct_sequences.

The present invention provides prostate-specific coding sequences and their encoded proteins. These can be used in the diagnosis and treatment of cancers, particularly prostate cancer. The present sequence is a protein described in the invention.
                                                                                                                                                  New prostate-specific polynucleotides for diagnosing and diseases, in particular prostate cancer, and as markers f progression of cancer -

    cancer; prostate cancer; vaccine; cytostatic;
therapy.

                                                                                                                                                                                                                                                                                                                                                                CARTER D.

The invention relates to olfactory and Pheromone G-protein coupled receptor (GPCR) or a protein 95% identical to the GPCR, a specific active portion and its encoding polymucleotide. Also included are an agonist, antagonist or inhibitor of the GPCR or the polymucleotide, a vector
                                                                                                                                                                                           Novel pheromone G-protein coupled receptor and receptor-derived agonists, antagonists or inhibitors useful in food or cosmetic pror in the treatment or prevention of neurological disorders such anxiety and schizophrenia

human mammal comprising a partial or total deletion of the polynucleotide
cencoding the receptor and screening (detection and possibly, recovering)
of compounds which are known or not known to be agonist, antagonists or
inhibitors of natural compounds to the GPCR. The receptor-derived
agonists, antagonists, inhibitors or compounds are used as an
improvement, elimination or substitution of an existing taste and/or a
crimprovement of (or in) the food and/or cosmetic products. They can also be
improvement of the food and/or cosmetic products. They can also be
created in the preparation of medicament in the treatment and/or prevention
of a mammalian disorder, such as cell migration, sterility, psychotic and
neurological disorders, including anxiety, schizophrenia, manic
depression, depression, for promoting axonal growth, nerve cell
comnection and nerve regeneration for modulating male and female
commerciane functions, hormone production and the menstrual cycle, for the
prevention or the treatment by stimulation of several mammalian
behaviours, such as stimulation or suppression and for promoting or
suppressing chemical communication between organisms. The present
sequence is a human olfactory and pheromone GPCR protein sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method of representing sensory perception of one or more odourants. The method comprises: (a) providing a representative class of n olfactory receptors or ligand binding domains (LBD) of these receptors; (b) measuring values X1 to Xn representative of at least one activity of one or more odourants selected from:
(i) binding one or more odourants to the LBD of at least one of the n olfactory receptors; (ii) activating at least one of the n olfactory receptors with the one or more odourants; and (iii) blocking at least one of the n olfactory receptors with the one or more odourants; and (c) generating a representation of sensory perception from the values X1 to Xn. The representation of the sensory perception of odourants is useful for the design and formulation of doour and taste compositions. AAUSS140-AAUSS33 represent human olfactory G-coupled receptor amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Representing sensory perception of one or more odourants identification and design of tastes and odours comprises representative group of n olfactory receptors -

                                                                 The invention describes a fusion protein comprising at least one aminc acid sequence of immunogenic portions of any of the 3 sequences not defined in the specification, or sequences having at least 70 or 90 % sequence identity to any one of the 35 sequences defined in the USPTO web site, which is encoded by any of the 4 nucleotide sequences not defined in the specification. The fusion protein, composition and methods are useful for diagnosing, preventing and/or treating cancer, particularly prostate cancer. The proteins are useful as markers to indicate the presence or absence of cancer. This is the amino acid sequence of a prostate cancer therapy associated protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly seconds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (XUJJ/)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC G protein-coupled receptor (GPCR) or a candidate polypeptide in a sample; and (2) an isolated antibody having high specificity and high affinity cor avidity for a particular GPCR. (1) can be used as GPCR modulators and consider the production of a particular GPCR, and in the production of specific presence or absence of corresponding GPCR, and in the production of specific presence or absence of corresponding GPCRs. The antigenic peptides for CC GPCRs and antibodies are useful for diagnosing and designing drugs for creating immune-related diseases, growth-related diseases, cell corresponding GPCRs. The antigenic peptides for CC regeneration-related diseases, growth-related cell proliferative diseases, or autoimmune diseases, e.g. AIDS, Alzheimer's disease, cell costeoarthritis, osteoporosis, cancer, cardiomyopathy, chronic and acute inflammation, allergies, Crohn's disease, diabetes, graft versus host CC disease, Parkinson's disease, multiple sclerosis, pain, psoriasis, canxiety, depression, schizophrenia, dementia, mental retardation, memory cost, epilepsy, asthma, tuberculosis, obesity, nausea, hypertension, cany other disorder in which GPCRs are involved. The antibodies may be complification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention relates to a novel G-protein-coupled receptor up-regulated CC in prostate cancer, termed PHOR-1. The encoding cDNA is contained in CC plasmid designated pl01p3A11 deposited with ATCC as Accession No.pTA-312. CPOR-1 polypeptides and polypurcleotides are useful for diagnosing the CC protein or rectal cancer by determining and comparing the level of the CC protein or mRNA expression in test and normal tissue samples. CC protein or mRNA expression in test and normal tissue samples. CC Pharmaceutical compositions comprising PHOR-1 is useful for treating CC cancer. PHOR-1 proteins are useful for identifying ligands and other agents and cellular constituents that binds to PHOR-1 gene product and CC for generating antibodies which are useful in diagnostic, prognostic and CC ines expressing PHOR-1 are useful for identifying protein-protein cC interactions mediated by PHOR-1. The present sequence represents a cDNA canced in the formal control of the composition of the control o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
